

Best Technology Stack (Recommended)

Frontend

- **Next.js 15** (React Framework)
- **TypeScript**
- **Tailwind CSS**
- **Framer Motion** (smooth animations)

Backend

- **NestJS** (preferred for enterprise applications)
- **Node.js**

Database

- **PostgreSQL**

ORM

- **Prisma ORM**

Storage

- **AWS S3 or Cloudinary** (for package images)

Caching

- **Redis**

Search

- **PostgreSQL Full-Text Search** (upgradeable to Elasticsearch later if needed)

Authentication

- **JWT**
- **Google Login** (future-ready)

Deployment

- **Docker**

- Nginx
- VPS/AWS/DigitalOcean

Features Like Thomas Cook (Only for Tour Packages)

Homepage Search

Customers should be able to search by:

- Destination
- Travel Month
- Departure Date
- Budget
- Number of Travelers
- Package Type

Filters

Customers should be able to filter by:

Destination

- Domestic
- International

Budget

- ₹20k–40k
- ₹40k–60k
- ₹60k+

Hotel Category

-  3-Star
-  4-Star
-  5-Star

Trip Type

- Honeymoon
- Family
- Group

- Corporate
- Adventure
- Luxury
- Weekend Getaway

Duration

- 2–4 Days
- 5–7 Days
- 8–10 Days
- 10+ Days

Meals

- Breakfast
- Breakfast + Dinner
- All Meals

Transport

- Flight Included
- Train Included
- Cab Included

Package Details Page

Every package should contain:

- Hero Image
- Package Gallery
- Starting Price
- Duration
- Destination
- Day-wise Itinerary
- Hotel Information
- Hotel Star Rating
- Flight Information (if included)
- Cab Information
- Meals
- Inclusions
- Exclusions
- Cancellation Policy

- FAQs
 - Customer Reviews
 - Download PDF Itinerary
 - Enquiry Form
 - WhatsApp Button
 - Call Now Button
-

Admin Panel

Your staff should be able to:

- Add Packages
 - Edit Packages
 - Delete Packages
 - Upload Images
 - Upload PDF Itinerary
 - Change Hotel Ratings
 - Change Prices
 - Enable/Disable Packages
 - View Customer Enquiries
 - Export Leads
 - Manage Testimonials
 - Manage Blogs
-

Inquiry Flow

1. Customer searches for a package.
 2. Customer applies filters.
 3. Customer opens the package.
 4. Customer clicks **Send Enquiry**.
 5. Enquiry is saved in the admin panel.
 6. Customer receives an email confirmation.
 7. Your sales team follows up and completes the booking offline.
-

Don't Build Yet

At this stage, **do not** build:

- Online payment gateway
- Flight ticket booking engine
- Hotel inventory system
- Live airline API integration
- Live hotel API integration

Since your business **sells curated travel packages**, these features will add significant cost without much benefit right now.

Scalability

The developer should design the architecture so that you can later add:

- Online payments
 - Customer login
 - Booking history
 - EMI options
 - Referral program
 - Multi-language support
 - International currencies
 - CRM integration
-

Final Recommendation to the Developer

Build a **custom-coded, enterprise-grade travel package management system** using **Next.js + NestJS + PostgreSQL + Prisma + Tailwind CSS**. The website should be fast, SEO-friendly, mobile-first, scalable, and allow customers to search and filter tour packages by destination, departure date, hotel category (3★/4★/5★), budget, duration, and trip type. It should include a powerful admin panel for managing packages, images, PDF itineraries, inquiries, blogs, and testimonials. The system should be designed so future features like online payments and customer accounts can be added without rebuilding the website.
